

ABSTRACT

Disclosed is an inorganic-organic composite functional  
5 composition which comprises an organic resin and an inorganic  
matter having an organic layer which is formed in a solvent  
containing an ionic liquid. A formed article made of such an  
inorganic-organic composite functional composition can be  
prevented from deterioration in the physical properties even  
10 when a large amount of the inorganic matter is dispersed in  
the organic resin.
